Project Name: Online Blood Management System

Introduction:

We are making a user-friendly webpage that records and manages the blood donation process, user and donor registration and data management of other related information.

Aim:

Our goal is to create an online blood management system which will create an online platform for blood donors and people who are in need of blood.

Features:

- The website will contain registration option for both Blood seekers and donors. Those who're looking for blood and those who're willing to donate blood can register.
- After registration, users (donor & seeker) can log in for further details using their user id and password.
- The date of registration will be stored in database.
- Those who're in need of blood can look out for available donors, their information and availability of blood they're looking for.
- A donor can log in and see if someone needs blood and if they can provide.
- There will be an admin panel who'll monitor and authorize all data and information of the website. The website will contain information about admins. But only the admins will be able to see that.
- The admin body will have one or more managers who supervises them.
- Admins will have their own login for the website.

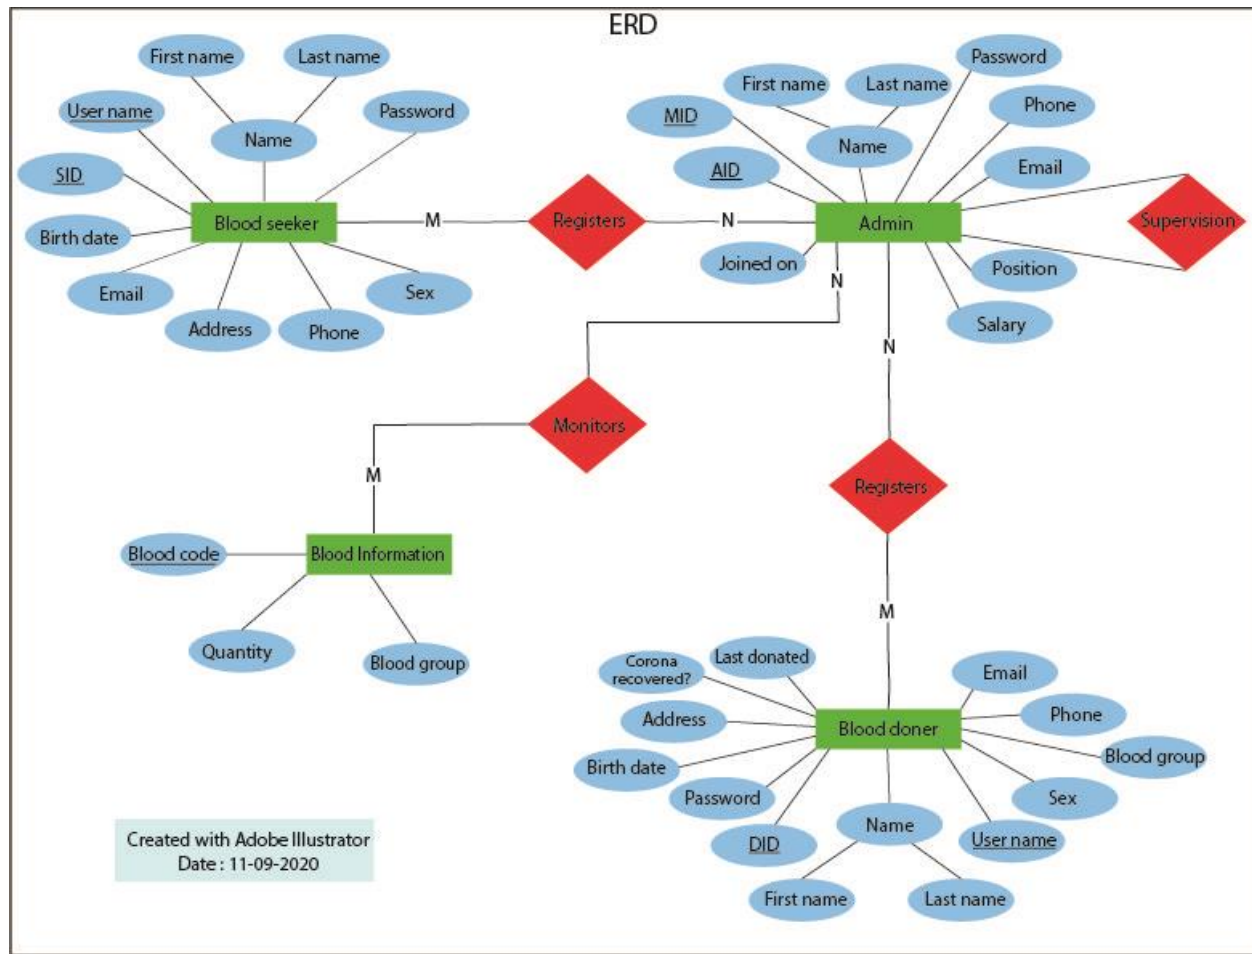

Technologies:

- 1.**MYSQL & XAMPP**- We will be making the database for this project using MySQL.
- 2.**HTML**- The frontend of the webpage is structured using HTML.
- 3.**CSS**- Styling elements have been added to the webpage using CSS.
- 4.**Bootstrap**- Open source CSS framework
- 5.**PHP**- we will use PHP in the backend so that our webpage connects with the database and functions smoothly.
- 6.**MS Word**- MS Word is used to make the proposal of the project also other required messages and information.

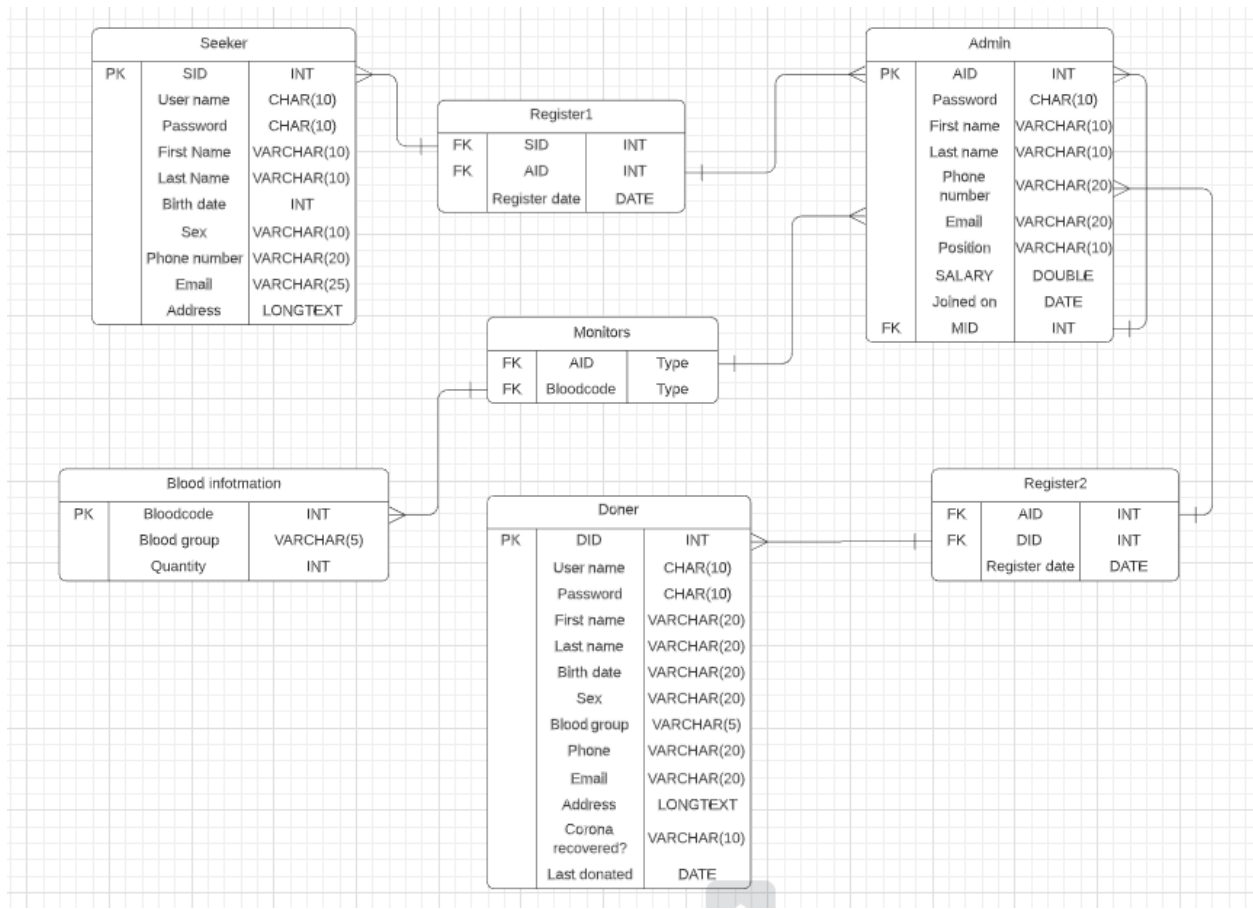

Optional:

1. Javascript, jQuery, Laraval, Datatable, template for the website.
